qraezev

THE EXPERIENCE LAYER FOR PHYSICAL AI

Machines that learn from experience.

Robots can see now. They still can't remember.

An experience layer is software that lets any robot or machine keep, reuse and improve what it learns on the job, so integration costs fall.

Prototype phase

IDEATION STAGE · PRE-SEED

PROBLEM

Robots start from zero. Every time.

Every repeated miss costs engineer hours, line downtime and rework.

Day 1

1 failed attempt

Day 100

The same miss, again

Day 1,000

Still the same miss

Each gold dot is one failed attempt at the same task.

50%+

of a robot system's cost is integration and programming, not hardware.

4–5×

A full robot system typically costs 4–5 times the price of the robot itself.

73%

of manufacturers surveyed say programming a robot takes a week to a month.

SOLUTION · MEMORY BETWEEN SENSORS AND MOTORS

Give any robot a memory to learn and adapt.

Sees

Cameras and sensors

Example: the part sits 4 mm off-center.

THE CORE INNOVATION

Remembers and decides

qraezev

Example: last time, a straight push jammed. Shift 4 mm first.

Moves

Existing controller and safety

Example: moves 4 mm, then pushes. No jam.

WHAT IT IS

Software on top of a robot's existing sensors and controller. It never replaces them.

HOW IT WORKS

Forms experiences and links them by relation. In a new situation, related memories fire together and decide the move.

ANY ROBOT, ANY MACHINE

One brain, one thin adapter per robot. Runs as software or as a fully offline onboard module.

Target: 50% fewer failed trials than no memory. A goal, to be proven in simulation first.

WHY NOW

Seeing is solved. Remembering is not.

PERCEPTION · SOLVED

5M

Robots can already see and follow instructions.

5 million industrial robots work in factories worldwide, up 9% in 2025.

HARDWARE · AFFORDABLE

~$320

Seeing is now affordable.

A depth camera like the Intel RealSense D435 costs about $320, so every robot can have eyes.

MEMORY · THE MISSING PIECE

600K+

Learning after deployment is unsolved.

Over 600,000 new robots were installed in 2025. Each one starts blank and learns nothing from its own failures.

MARKET · BARS NOT TO SCALE

A small slice of a very large base.

TAM · EVERY ROBOT

5,000,000 robots worldwide

600,000+ installed in 2025. Ceiling of about $25B a year at $5,000 per robot: not our forecast.

SAM · ROBOTS THAT REPEAT, VARY, ALLOW SOFTWARE

250,000 robots ≈ $1.25B a year

Repeated tasks, real variation, measurable failures, open software access.

SOM · FIRST 100 ROBOTS

100 robots ≈ $0.5M a year

From 1–3 design partners to 10–20 paid pilots.

$1.2B → $5.8B

Cobot market forecast, a growth driver for our SAM. Dollar values assume $5,000 per robot per year: illustrative, not a forecast.

PRODUCT

Fail once. Remember. Succeed.

Trial 1

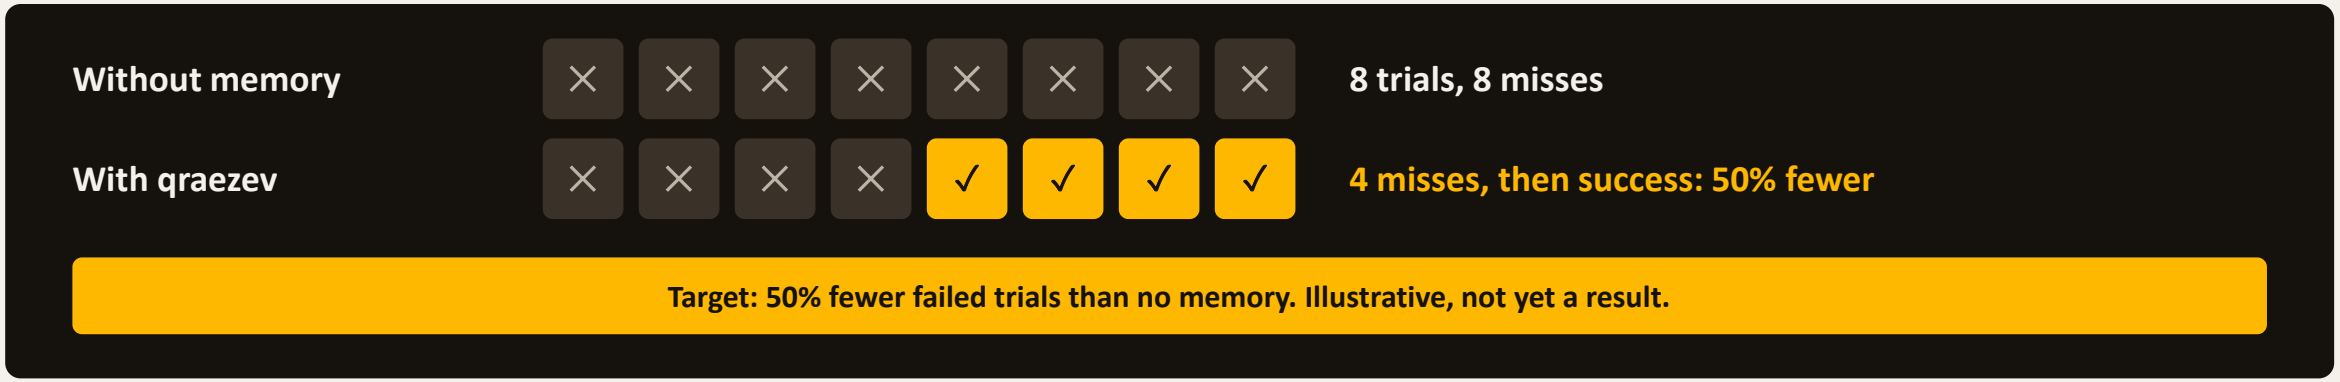

A new variation. The robot misses.

Memory

Each miss becomes a linked memory, recalled on the next try.

Trial 5

Having learned from trials 1 to 4, the robot succeeds.

qraezev Software

Runs on a robot's computer, a workstation, an edge box or in simulation.

qraezev Embedded

The same brain on a compact onboard module. Fully offline, no cloud needed.

COMPETITION

Memory is not the moat. The lifecycle is.

Works across robot makers

Foundation-model robotics

General skills, trained before deployment.

qraezev

Memory layers store and recall. We add the lifecycle: score, merge, forget.

Robot-maker stacks and scripts

Tied to one vendor, or reprogrammed by hand.

Lifelong-learning research

Strong methods, studied in labs.

Learns on the job →

WHO ELSE IS IN THE SPACE

Foundation-model robotics

Gemini Robotics, NVIDIA GR00T, Skild AI

Robot memory layers

Monolithos Robot Brain, robotmem, Memori. They store and recall only.

Robot-maker stacks and scripts

FANUC, ABB, Universal Robots, RoboDK

Lifelong-learning research

Academic work, e.g. Nature Machine Intelligence, 2025

Our moat: every deployment adds experience that only real machines can generate.

BUSINESS MODEL

Software per robot. Pilots first.

1 · PAID PILOTS

$10–75K

assumed fee per pilot

Research pilots $10–30K, industrial pilots $25–75K. Proves value, then converts to a license.

2 · PER-ROBOT LICENSE

$5–25K+

assumed per robot or workcell per year

Core recurring revenue, priced as a fraction of the intervention and downtime it removes.

3 · ENTERPRISE AND FLEET

$100K+

assumed per customer per year

Fleet and enterprise deals. Integrators and OEMs extend distribution for an assumed 10–20% share.

ANNUAL OPPORTUNITY AT $5,000 PER ROBOT PER YEAR (ILLUSTRATIVE)

$500M	**100,000 robots**
$1.25B	**250,000 robots**
$2.5B	**500,000 robots**

Pricing logic: a fraction of the intervention and downtime cost removed. All prices are starting assumptions.

GO TO MARKET

Start narrow. Prove it. Then scale.

NOW TO MONTH 9

1 · Design partners

Research labs and robotics startups.

Technical proof · 1–3 partners

MONTH 9–15

2 · Paid pilots

Robotics companies, industrial R&D and advanced manufacturing.

Economic proof · 10–20 pilots

AFTER THE SEED

3 · Production licenses

Per-robot and workcell licenses, with integrators selling them.

Recurring revenue · 100+ robots

LATER

4 · Platform

OEM and fleet licensing across mobile robots, humanoids and other machines.

Scale · many robots

FIRST CUSTOMERS

Robotics startups and research labs in the US, Europe and India: they have robots and repeated failures.

DISTRIBUTION

System integrators embed qraezev in the robot cells they build. Robot makers follow once it is proven.

BUILD BASE

India: strong engineering talent, research institutions and low experiment costs. Customers are global.

TEAM

Two builders. One mission.

One team builds the mind, and the machine it runs on.

Dinesh Polavarapu

Founder & CEO

B.Tech Mechanical, IIT Tirupati. Won the Nation Builder competition with Guardian, an AI health wearable. Built LifeLine AI, a healthcare assistant. Arduino PID control builds.

Mokshagna Anurag Kankati

Co-founder & CTO

B.Tech ECE, MVGR College. 3+ years in robotics and UAVs. Interned at NITK, IIT Tirupati (CubeSat), Zebu Intelligent Systems and Daloft Aerospace. 2nd place, AVISHKAR.

The raise adds a core engineering team to build the first robot integration.
